

Introduction

Francisco Villamil

Applied Quantitative Methods II
MA in Social Sciences, Spring 2026

1/25

Course overview

- This is the second part of the quantitative methods sequence
- Focus on **applying** statistical tools in practice
- Less theory, more hands-on work with data
- Goal: go from research question to answer

2/25

What will you learn?

- How to choose the right model for your question
- How to interpret and visualize model results
- How to evaluate whether a model is appropriate
- How to work with different types of data (panel, spatial, etc.)
- Best practices in computing and reproducibility

3/25

Course structure

Feb 5	Introduction
Feb 12	Applied regression
Feb 19	Applied regression II (binary)
Feb 26	Interpretation and diagnostics
Mar 5	Best practices in computing <i>(move just before break?)</i>
Mar 12	Panel data I
Mar 19	Panel data II
Mar 26	Spatial data
<i>Easter break</i>	
Apr 9	Spatial data
Apr 16	Other outcomes
Apr 23	Project presentations
Apr 30	Exam + Review

4/25

Evaluation

- Problem sets (20%)
 - Started in class, finished at home
 - Short deadlines
- Proposal presentation and peer review (10% + 10%)
- Final essay (30%)
 - Small research note (max 3,000 words)
 - Original data analysis using R
- Exam (30%)

5/25

Roadmap

The Big Picture

Version Control and Git

6/25

The Big Picture

7/25

The research process

Theory \longleftrightarrow Data Generating Process \longleftrightarrow Data

- Theories make claims about how the world works
- These claims imply certain patterns in data
- We observe data and try to learn about the underlying process

8/25

What is a Data Generating Process (DGP)?

- The rules that govern how data comes to exist
- Includes:
 - The social or political process we study
 - How observations end up in our dataset
- We never observe the DGP directly
- We use statistical models to make inferences about it

9/25

Why do we need statistics?

- Our theories deal with processes, not just data
- Data is a window into the underlying process
- Statistics helps us:
 - Separate signal from noise
 - Quantify uncertainty
 - Make valid inferences

10/25

Sources of uncertainty

- **Sampling uncertainty:** We observe a sample, not the population
- **Theoretical uncertainty:** Our theories are simplifications
- **Fundamental uncertainty:** Some processes are inherently random

- All of these create “noise” in our data
- Statistical models help us deal with this noise

11/25

The logic of statistical inference

- **Probability theory:** Given a known process, what data will we see?

- **Statistical inference:** Given observed data, what can we learn about the process?

- We're doing the reverse: from data back to process

12/25

Roadmap

The Big Picture

Version Control and Git

13/25

Version Control and Git

14/25

The problem: managing files over time

- Have you ever had files like this?
 - `thesis_v1.docx`
 - `thesis_v2_final.docx`
 - `thesis_v2_final_REAL.docx`
 - `thesis_v2_final_REAL_submitted.docx`
- What changed between versions?
- Which version has the correct analysis?
- How do you collaborate without overwriting each other's work?

15/25

Version control: a better way

Version control is a system that records changes to files over time

- One file, complete history
- Every change is recorded with a description
- Can go back to any previous state
- Multiple people can work simultaneously

16/25

Why version control for research?

- **Reproducibility:** Track exactly what you did and when
- **Backup:** Your work is safely stored, even if your laptop dies
- **Collaboration:** Work with others without email chains of files
- **Transparency:** Share your code with the research community
- Many journals now require or encourage sharing code via GitHub

17/25

Git and GitHub

Git

- A version control system
- Runs locally on your computer
- Tracks changes to files

GitHub

- A web platform that hosts Git repositories
- Stores your code online
- Enables sharing and collaboration

18/25

The basic Git workflow

1. **Make changes** to your files (write code, edit text)
2. **Stage** the changes you want to save
 - “These are the files I want to include in my next snapshot”
3. **Commit** the staged changes with a message
 - A snapshot of your project at this moment
4. **Push** your commits to GitHub
 - Upload your local changes to the cloud

19/25

Ways to use Git

- **GitHub web interface:** Create repos, upload files, edit directly
 - Simple but limited
- **Command line:** Most powerful and flexible
 - `git add`, `git commit`, `git push`
- **RStudio:** Built-in Git integration
 - Point-and-click interface
- All do the same thing—choose what works for you

20/25

Assignment 1

- Create a GitHub account (if you don't have one)
- Create a **public** repository for this course
- Set up your README and folder structure
- Create a simple .R file

- This repository is where you'll submit all your assignments
- Detailed instructions in the assignment document

21/25

What makes a good analysis?

- Clear research question
- Appropriate data for the question
- Right statistical model for the data
- Correct interpretation of results
- Honest about limitations and uncertainty

22/25

Looking ahead

- Next session: Applied regression
- Regression as conditional expectations
- Multiple regression and control variables
- Interaction effects and presenting results

23/25

For next week

- Read Urdinez & Cruz (2020), chapters 1–5
- Read Gelman et al., chapters 6–7 and 10
- Read BdM & Fowler, chapters 5 and 10
- Review your notes on OLS from AQMSS-I
- Start Assignment 1

24/25

Questions?
